

T-REX

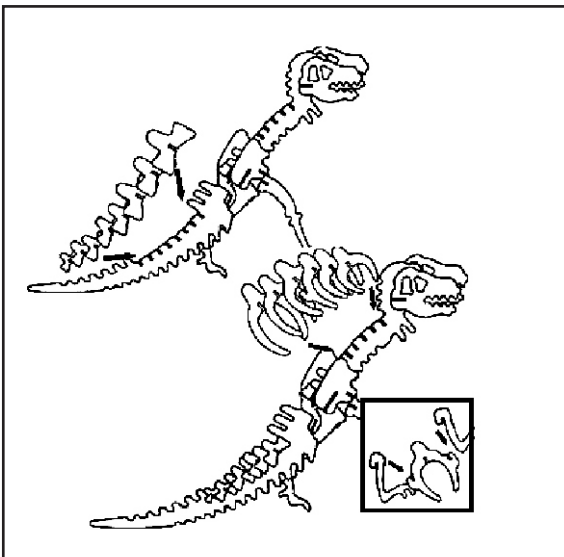

Start by attaching the tail piece to the hip, then the hip to the back.

Next attach the three pieces that make up the head.

Use the diagram to help identify each piece.

Next, put together the legs and the rest of the hip pieces, attaching them to the already assembled portion of the dinosaur.

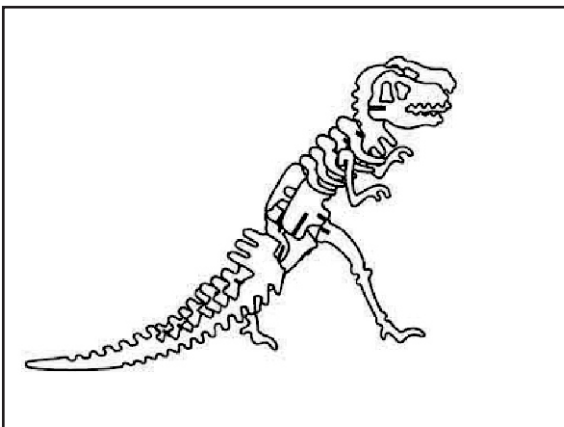

For the tail vertebrae, arrange each of the eight pieces from smallest to largest.

The smallest piece goes into the slot at the far end of the tail, while the largest piece goes in the slot closest to the legs.

When you have the tail finished, you can add the back vertebrae.

There are six pieces that we will arrange from smallest to largest with the largest piece inserted in the slot closest to the legs and the smallest nearest the head.

The third vertebrae from the head should be the piece pictured in the box to the right. You'll notice that this piece has two additional slots to place the arms.

Your T-Rex is complete!
